Project Description: BOOKING SERVER NETWORK DESIGN (MODULE-1)

The **Booking Server Network Design Module** focuses on designing a reliable network structure for the railway e-ticket booking system. It establishes communication between users, the booking server, and the database so that ticket booking requests can be processed efficiently. The module manages multiple booking requests sent to the server and provides a proper network architecture for handling concurrent users.

It also focuses on maintaining **fast communication, reliable data transfer, and secure access** to the booking system. The network design helps the server handle a large number of users at the same time while reducing delays and communication errors. This module provides the basic network infrastructure required for smooth and efficient railway e-ticket booking operations.
